

BIOMARKER STUDY FOR TREATMENT RESPONSE in DEPRESSION

Feeling depressed or have been diagnosed with depression?

Brain
Resource
Center

The aim of this study is to identify [brain, cognitive and genetic markers](#) that predict treatment response to 3 antidepressant medications.

This study is for male or female individuals who are:

- 18-65 years of age
- Diagnosed with major depressive disorder and no recent use of antidepressant medication
- Whose primary language is English

You will be required to satisfy study criteria and attend a medical screening and clinical assessment before being permitted to participate in the study.

- While your **brain activity** is being measured via non-invasive brain-mapping methods, you will be asked to perform various tasks (e.g. focused attention, memory recall, etc.). You will also be asked to provide a blood sample, and answer questions about your medical history.
- The study will involve two 5-6 hour testing sessions and additional 30 minute phone and internet follow-up sessions.
- You will be compensated for your time and any costs incurred in participating in this study.
